

UNWRAPT / STRATEGIC REVIEW

Build trust. Complete the thoughtful act.

A visual product audit and operating plan covering UI/UX, analytics, experimentation, monetization, marketing, and the roadmap from concierge beta to a repeatable gifting agent.

Product thesis Thoughtful gifting without the mental load.	Immediate wedge Remember, recommend, approve, deliver.	North star On-time gifts users are proud to send.
---	---	--

The opportunity is real. The experience must earn trust.

Unwrap has a strong emotional premise, a distinctive concierge identity, and much of the technical workflow. The launch risk is coherence: the product currently promises more automation than the interface can consistently prove.

Headline assessment	Scale learning before acquisition
The best wedge is not AI gift ideas. It is reliable follow-through: remember the moment, surface one strong recommendation, get approval, complete the order, and confirm delivery.	Recruit a small concierge beta, manually review recommendations and exceptions, and prove that users trust the result. Paid growth should follow a dependable first delivered gift.

8.5 emotional premise	1 clear product loop	0 verified daily traffic baseline	1 active CTA hypothesis
--------------------------	-------------------------	--------------------------------------	----------------------------

Position the service as a relationship concierge.

The emotional promise should lead; AI should remain backstage. Unwrapt wins when it feels like a trusted operator that remembers context and completes the task, not a marketplace that happens to recommend products.

The moat is reliable follow-through, not idea generation.

POSITIONING STACK

Layer	Recommended message	Proof required
Emotional	Be the thoughtful person you want to be without carrying all the mental load.	A real delivered-gift story and recipient reaction.
Functional	Approve the gift. Unwrapt handles the rest.	Price, retailer, delivery date, approval, tracking.
Product	Your personal gifting concierge remembers people, dates, taste, and budget.	Persistent recipient memory and visible preference controls.
Technology	Agentic intelligence quietly coordinates the workflow.	Reliable exceptions and human review, not AI theater.

One sentence to use now

"Unwrapt remembers the moments that matter, recommends a gift that fits, and handles delivery after you approve."

Trust fixes already implemented in the working branch.

The first pass removed avoidable contradictions and repaired entry-point friction. These changes are local and verified, not yet deployed.

Area	What changed	Why it matters
Routing	Recognize both unwrap.io and www.unwrap.io; add SPA rewrites.	Visitors reach the intended marketing surface and direct routes stop failing.
Landing	Stop replaying the intro; remove unverified vanity metrics; keep navigation visible.	Faster time to value and fewer credibility gaps.
Sign-in	Clarify that Google is used for authentication; calendar access is optional and requested later.	Separates identity from data permission.
Onboarding	Remove the dead calendar action and decorative payment form; show a no-card-required setup summary.	No simulated checkout or ambiguous billing.
Approval	Use 'Always ask before purchase' and explain that nothing ships until approval.	Aligns the interface with the trust model.
Pricing	Remove \$19 autopilot references and emphasize transparent gift cost.	One offer story instead of competing promises.
Analytics	Enable Vercel Web Analytics and add a Supabase funnel/event migration plus deterministic experiments.	Creates a path from opinion to measurable learning.

Verified

Production build passes. Targeted changed-file lint passes. Desktop and 390 px mobile previews render without console errors.

Not yet live

The branch, tracking package, Supabase migration, and experiment must be reviewed and deployed before real data can accumulate.

Known debt

The existing repo still has a large bundle, oversized images, broad lint debt, dependency findings, and no automated test suite.

Redesign the journey around one valuable decision.

Every screen should reduce uncertainty about what happens next. The ideal user experience is a calm concierge inbox where each request explains the occasion, the fit, the total, and the deadline.

Moment	Current friction	Recommended experience	Primary metric
First visit	Long visual story before proof.	Show one recommendation card in the hero; keep the story secondary.	CTA click rate
Sign-in	Google can imply broad data access.	Explain sign-in first; ask for calendar permission later with a data boundary.	Auth completion
People	Calendar import can feel mandatory.	Offer three equal paths: calendar, manual, sample recipient.	People step completion
Preferences	Interest matching is not fully transparent.	Show how each interest changes the recommendation logic.	Profiles with 2+ interests
Recommendation	Generic match claims.	Use specific reasons: interest, budget, novelty, arrival date.	Approval rate
Approval	Fulfillment details appear late.	Show retailer, total, delivery window, return/exchange terms, and address status.	Approve-to-order rate
After approval	Status spread across dashboard elements.	One timeline: approved, ordered, shipped, delivered, exception.	On-time delivery

Concierge inbox information hierarchy

1 / NEEDS YOU

Recommendation, specific fit, total cost, delivery date, one primary action.

2 / IN MOTION

Order and delivery timeline with only exceptions elevated.

3 / UPCOMING

Moments approaching, profile gaps, and calm preparation.

Use two analytics layers: traffic plus product behavior.

Vercel Web Analytics provides privacy-conscious traffic and page metrics. Supabase captures the proprietary funnel and experiment signals that free Vercel custom events do not provide.

Instrument each transition before optimizing it.

Layer	What it answers	Status	Access rule
Vercel	Visitors, page views, bounce, pages, referrers, country, device.	Enabled on Hobby; client package added locally.	Aggregate traffic only.
Supabase	CTA, auth, onboarding steps, completion, variant exposure and conversion.	Migration and client events prepared locally.	Browser inserts; no browser reads; reporting RPC is service-role only.
Codex loop	Daily baseline, friction hypothesis, experiment decision, stakeholder summary.	Scheduled for 8 AM daily and 10 AM weekdays.	No invented metrics; no silent deployment.

Data minimization

Do not record names, emails, phone numbers, addresses, gift details, tokens, or free-form personal context. Store anonymous/session identifiers, event names, paths, bounded properties, experiment key, and variant. Respect Global Privacy Control and provide an opt-out.

Start with one test: outcome language vs generic signup language.

The first experiment asks whether a concrete job-to-be-done reduces ambiguity better than a generic call to action. The implementation assigns users deterministically and records exposure before conversion.

Field	Definition
Experiment	landing_primary_cta_copy_v1
Control	"Get Started Free" / "Get Started"
Variant	"Plan My First Gift" / "Plan a Gift"
Hypothesis	Outcome-specific language will increase qualified CTA engagement and sign-in starts because visitors understand the immediate job being completed.
Primary metric	Auth starts per experiment exposure.
Guardrails	Onboarding completion, mobile click-through, no increase in immediate return/bounce.
Minimum decision rule	Do not declare a winner before at least 200 exposed visitors per variant and 40 auth starts total; extend when traffic is low.
Rollback	Disable if variant harms auth starts by 20%+ after 50 exposures per arm, or causes functional/accessibility regressions.

Experiment operating rules

One variable

Change one meaningful element at a time so the result is interpretable.

One primary metric

Choose the decision metric before seeing results; keep guardrails separate.

One active test

At current traffic, parallel tests create noise and prolong decisions.

Permanent changes stay reviewable. Daily automation may prepare a flagged local variant, but it should not deploy, alter payments/auth/security, or promote a winner without review.

Charge for persistent execution, not access to a catalog.

The current \$4.99 monthly offer is easy to understand but may be too low for human quality control, exception handling, payment costs, and support. Validate willingness to pay and contribution margin before hard-coding the business model.

Model	Customer promise	Best use	Watch-out
Member / \$99 yr	Up to 5 people, proactive recommendations, approval, tracking, no service fee.	Frequent personal gifters.	Must prove repeated annual value.
Select / \$249 yr	Up to 15 people, priority human review, exchange help, faster exceptions.	High-intent concierge users.	Operational capacity and SLA.
Gift Rescue	One urgent occasion, curated shortlist, transparent \$7-\$12 handling fee.	Low-friction acquisition.	Avoid becoming a one-off marketplace.
Corporate pilot	Client/team calendar, approvals, budgets, reporting.	Higher ACV after personal loop works.	Do not distract the core team yet.

RECOMMENDED PRICE VALIDATION

Test A

\$99 annual membership. Gift cost, tax, and shipping shown separately.

Test B

No subscription. Charge a transparent \$7-\$12 fee only when an approved gift is completed.

Decision

Compare paid conversion, gifts per user, support minutes, contribution margin, and 90-day repeat.

Affiliate and retailer revenue should improve margin but never determine ranking. Recommendation integrity is the economic asset.

Go to market through urgent moments, then earn the annual habit.

The strongest initial customer is a busy professional with 5-12 important relationships, disposable income, and a repeated pattern of late or stressful gifting.

Motion	Offer	Channel	Conversion bridge
Founder concierge beta	30-50 users; every recommendation and exception reviewed.	Founder networks, professional groups, parenting/family circles.	Interview after first delivered gift.
Gift Rescue	Five questions to three arrival-safe options.	High-intent search, seasonal social, creator demos.	Import the rest of your dates after purchase.
Proof content	Show the actual recommendation-to-delivery loop.	Short-form video, email case study, landing-page proof.	Join beta or rescue one occasion.
Recipient loop	Tasteful 'coordinated with Unwrap' reveal and exchange support.	Delivered gift, recipient page, referral.	Recipient becomes a giver.
Seasonal engine	Valentine's, Mother's/Father's Day, graduation, weddings, holidays.	Occasion landing pages and partner creators.	Convert seasonal urgency to year-round memory.

Message hierarchy

1 Never miss the moment	2 Get one strong fit	3 Approve in under a minute	4 We handle delivery
-----------------------------------	--------------------------------	---------------------------------------	--------------------------------

Do not lead with

"AI-powered marketplace," broad feature lists, simulated automation, or a subscription before the user sees a recommendation worth trusting.

Roadmap: prove one complete gift before expanding scope.

Prioritize reliability, transparency, and learning. Each phase ends with a measurable gate, not merely a shipped feature list.

Window	Product	Operations	Exit gate
0-30 days	Deploy routing/trust fixes; finish analytics; unify offer copy; add sample recommendation; compress major assets.	Recruit 10 design partners; manually review every recommendation.	90% onboarding completion among recruited testers; no false billing/automation claims.
31-60 days	Concierge inbox; recommendation reasons; approval total; order timeline; exchange/exception states.	Run real fulfillment playbook with daily exception review.	80%+ gift approval; 95% on-time delivery; support playbook documented.
61-90 days	Gift Rescue; annual vs per-order pricing test; recipient referral loop.	Expand to 30-50 paying beta users; founder interviews.	Positive contribution margin per completed gift and meaningful 90-day repeat.
3-6 months	Preference learning, better alternatives, selective auto-approve thresholds, richer retailer catalog.	Merchant partnerships and exception SLAs.	Recommendation quality improves while support minutes fall.
6-12 months	Household plan and carefully scoped corporate pilot.	Dedicated quality/fulfillment operations.	Repeatable acquisition with durable retention and delivery quality.

Gate 1 / TRUST

Can a user explain exactly what Unwrap will do, charge, and access?

Gate 2 / RELIABILITY

Can the team deliver the approved gift on time and handle exceptions?

Gate 3 / ECONOMICS

Does repeated value cover fulfillment, support, and acquisition?

Run the company on a compact trust-and-execution scorecard.

Traffic matters only when it leads to a completed thoughtful act. The dashboard should connect acquisition, product behavior, operations, and economics.

Category	Daily/weekly metrics	Why it matters
Acquisition	Unique visitors, source, landing CTA rate, Gift Rescue starts.	Shows whether the promise earns attention.
Activation	Auth completion, people added, profiles with 2+ interests, onboarding completion.	Measures setup friction and data quality.
Recommendation	Recommendations viewed, approved, alternatives requested, skipped.	Direct signal of taste and trust.
Execution	Approve-to-order time, on-time delivery, exceptions, refunds/exchanges.	The service promise lives here.
Retention	Second gift completed, 90-day repeat, active recipients, dates imported.	Proves persistent value.
Economics	Gross margin, affiliate revenue, support minutes, exception cost, CAC payback.	Prevents underpricing concierge work.
Sentiment	First-delivery interview, recipient reaction, 'very disappointed' score.	Captures emotional product-market fit.

Daily decision rule

Observe -> compare to baseline -> identify the largest credible friction -> write one hypothesis -> run one bounded test -> wait for sufficient evidence -> review winner -> deploy intentionally.

Automation boundary

The 8 AM run reports and may prepare a local, feature-flagged experiment. The weekday 10 AM run sends the stakeholder update only from giraudelc@gmail.com. If analytics or sender identity is unavailable, it reports the blocker instead of inventing data or using a fallback.

Resolve operational and technical risk before scaling.

The repository contains meaningful capability, but its present quality signals are not yet consistent with an autonomous purchasing promise.

Risk	Evidence	Action	Priority
Commercial inconsistency	Multiple prices, trial terms, autopilot levels, and billing promises remain across code/docs.	Choose one beta offer and create a copy source of truth.	P0
False confidence	Historic hard-coded metrics and capabilities ahead of implementation.	Use beta language and only verifiable proof.	P0
Quality coverage	No automated test suite across a large React/Supabase surface.	Add smoke tests for auth, onboarding, approval, payment, fulfillment.	P0
Security/dependencies	Dependency audit reports 26 known findings, including high/critical items.	Triage exploitability and upgrade deliberately; do not run blind fixes.	P0
Performance	Main JS is roughly 951 KB before gzip; images reach about 1.3 MB.	Code-split Three.js/admin routes; convert responsive assets to WebP/AVIF.	P1
Analytics readiness	Vercel is enabled but deployment is pending; Supabase migration is unapplied.	Deploy tracking, apply migration, store service key only in secure runtime.	P0
Email identity	Gmail connector is authenticated as a retired/incorrect account.	Reconnect exactly as giraudelc@gmail.com before scheduled sends.	P0

The standard for launch

A user should never wonder: Did I authorize this? What will I be charged?
Will it arrive? Can I change it? What happens if something goes wrong?

The next five actions.

Complete the measurement and deployment loop, then recruit a small beta around the first delivered gift.

1	Review and deploy the trust/analytics branch. Confirm the exact production offer before release.
2	Apply the Supabase analytics migration. Provide the reporting job a securely stored service-role key; never place it in client code.
3	Reconnect Gmail as giraudelc@gmail.com. The automation is already configured to reject every other sender.
4	Recruit 10 design partners. Observe onboarding, manually review recommendations, and interview after delivery.
5	Use the first 200 exposures per variant. Evaluate CTA wording only after adequate traffic and guardrail review.

METHOD & SOURCES

Audit inputs: user-supplied Unwrap overview; MicahCG/unwrap repository and product documentation; local desktop and 390 px mobile product walkthrough; production build and targeted lint; Vercel project dashboard; dependency audit output.

External references: Vercel Web Analytics documentation; Supabase Row Level Security documentation; Stripe subscription pricing guide (updated Jan. 29, 2026).

Important limitation: no historical analytics baseline existed at review time. Pricing, conversion thresholds, and roadmap gates are hypotheses to validate, not forecasts or guarantees.

Make gifting feel effortless.
Make the operation feel
trustworthy.
